

Taxonomy Management: Roles, Skills, and Tags

TMS Admin Command Center - Module Elaboration

1. Defining Roles

- Hierarchical Mapping: Define Seniority levels (Junior, Mid, Senior, Lead) to establish career progression.
- Competency Benchmarking: Map specific proficiency requirements to each role to identify skill gaps.
- Functional Grouping: Categorize roles by department (Engineering, Sales, Operations) for targeted training.
- Inheritance Logic: Allow sub-roles to automatically inherit skill requirements from parent roles, simplifying setup.

2. Defining Skills

- Multi-level Proficiency: Structured criteria for L1 (Beginner) through L4 (Expert) stages of mastery.
- Validation Mapping: Link skills to assessments, AI problem statements, or external certifications for objective proof.
- Skill Clustering: Group related skills into competency clusters (e.g., 'Cloud Engineering') for high-level oversight.
- Weightage Influence: Assign base weights to skills based on their strategic importance to the organization.

3. Defining Tags

- Hot Skill Indicators: Metadata tags that trigger specialized 'Hot Skill' leaderboards and priority alerts.
- Domain Categorization: Tagging for industries (#OilAndGas) or specific tech stacks (#React, #Python) for better filtering.
- Search Optimization: Enables the Resource Management Team (RMT) to find niche experts instantly.
- Global Consistency: A curated, centralized tag library prevents duplicate entries and fragmented data.

Business & Operational Impact

- Eliminates data silos across disparate business units.
- Ensures automated resumes use verified, standardized corporate terminology.
- Facilitates AI-driven content generation by providing clear structural targets.
- Enables precise gap analysis at a project, unit, and organizational level.
